

SOAR Playbook Development

The objective of this task is to design and simulate a Security Orchestration, Automation, and Response (SOAR) playbook to automate incident response for phishing-related alerts.

A SOAR playbook was designed to automatically respond to phishing alerts. The workflow is triggered when a suspicious IP or phishing-related alert is detected.

Playbook Workflow Steps

1. Check IP Reputation: Query threat intelligence sources (e.g., OTX/VirusTotal)
2. Decision Making
 - If IP is malicious → proceed to containment
 - If not → close alert
3. Block IP Address: Block IP using firewall/CrowdSec (simulated)
4. Create Incident Case: Generate a case in TheHive
5. Notify Analyst: Assign tasks and notify SOC analyst

A SOAR playbook was designed to automate phishing incident response. The workflow includes IP reputation analysis, blocking malicious IPs, and creating cases in TheHive. A simulated alert was used to test the playbook, ensuring efficient detection, response, and documentation of security incidents.
