

Security Metrics and Executive Reporting

A security performance evaluation was conducted based on a simulated incident to assess the effectiveness of SOC operations. Key metrics such as Mean Time to Detect (MTTD) and Mean Time to Respond (MTTR) were calculated as 2 hours and 4 hours respectively, indicating moderate efficiency in identifying and handling security incidents. The False Positive Rate was estimated at 20%, suggesting a need for improved alert accuracy. The incident involved suspicious login activity, which was successfully detected and investigated using available tools. While the response process was effective, certain gaps were identified in automated detection and real-time monitoring capabilities. It is recommended to enhance threat intelligence integration, implement automated SOAR workflows, and strengthen user awareness training. These improvements will significantly reduce response time, minimize false positives, and enhance the overall security posture of the organization.
